

A raw embedding orientation map — 2,600 English dream reports

Dreams are placed by t-SNE on multilingual sentence-embedding geometry; faint threads are the 8-nearest-neighbour graph in the full 384-dimensional space, and white points are individual reports. The heat is the locally averaged nightmare index — a smoothed field, not a per-dream value — with contours at its 75th, 88th and 96th percentiles. Labels give the two strongest standardised content axes of a k-means region of the map and its size. This raw-embedding t-SNE is an orientation map: it does not use within-person deviations, preserve global distances, test connectivity, or establish natural regions. No text and no contributor identifiers are shown.
